Patm	Atmospheric air pressure - (As recorded from engine data)	972 [mBar]
Patm		97200 [Pa]
Tatm		15 [C]
Tatm		288 [K]
Relative Humidity		75 [%]

$$\rho_{\text{humid air}}^{[1]} = \frac{p_d}{R_d T} + \frac{p_v}{R_v T} = \frac{p_d M_d + p_v M_v}{R T}$$

where:

$\rho_{\text{humid air}}$	=	Density of the humid air (kg/m ³)	$\rho_{\text{humid air}}$	=	1.169922 Kg/m ³
p_d	=	Partial pressure of dry air (Pa)			
R_d	=	Specific gas constant for dry air, 287.058 J/(kg·K)			
T	=	Temperature (K)		0.495620912	
p_v	=	Pressure of water vapor (Pa)			
R_v	=	Specific gas constant for water vapor, 461.495 J/(kg·K)			
M_d	=	Molar mass of dry air, 0.028964 (kg/mol)			
M_v	=	Molar mass of water vapor, 0.018016 (kg/mol)			
R	=	Universal gas constant, 8.314 J/(K·mol)			

The vapor pressure of water may be calculated from the saturation vapor pressure and relative humidity. It is found by:

$$p_v = \phi p_{\text{sat}}$$

$p_v = 1278.921 \text{ [Pa]}$

Where:

p_v	=	Vapor pressure of water
ϕ	=	Relative humidity
p_{sat}	=	Saturation vapor pressure

The saturation vapor pressure of water at any given temperature is the vapor pressure when relative humidity is 100%. One formula^[1] used to find the saturation vapor pressure is:

$$p_{\text{sat}} = 6.1078 \times 10^7 \frac{e^{\frac{17.625 T}{T + 243.04}}}{T^2}$$

$p_{\text{sat}} = 17.05228 \text{ hPa}$
 $p_{\text{sat}} = 1705.228 \text{ [Pa]}$

where T is in degrees C. Note:

This will give a result in hPa (100 Pa, equivalent to the older unit millibar, 1 mbar = 0.001 bar = 0.1 kPa)

p_d is found considering partial pressure, resulting in:

$$p_d = p - p_v$$

$p_d = 95921.08 \text{ [Pa]}$

Where p simply denotes the observed absolute pressure.

$$\rho = \frac{p}{R_{\text{specific}} T} \quad 1.17572 \text{ [kg/m}^3\text{]}$$

R = 287.058 J/Kg K
T = Temperature in degrees Kelvin
P = Absolute Pressure in Pa
